Introduction to Training Test Answer Guide

This California Science Test (CAST) training items scoring guide offers details about the items, student response types, correct responses, and related scoring considerations for the included samples of training items. These items have been selected to show some of the new approaches to measuring the California Next Generation Science Standards (CA NGSS) that can be found in the assessment. The training test items are not fully representative of all possible item types included in the CAST, but additional samples will be provided over time. The samples cover a selection of items from performance expectations from high school.

The following information is presented along with each item:

Performance Expectations (PE) Code: References the assessable evidence statements of what students should know and be able to do.

Science and Engineering Practices (SEP): Descriptions of behaviors that scientists and engineers engage in as they investigate the natural world and design solutions, respectively.

Disciplinary Core Ideas (DCI): Essential ideas in the science disciplines that all students should understand.

Crosscutting Concepts (CCC): Interdisciplinary skills that unify the study of science and engineering through common application across fields.

Depth of Knowledge (DOK): A measure of complexity that considers the students' cognitive process in response to an item (There are four DOK levels, with 4 being the highest.)

Item-Level Claim Statement (ILCS): A brief statement that illustrates how an item aligns to the PE through at least two of the dimensions (An ILCS is included with each item to help item reviewers (1) identify the intent of the alignment, (2) determine if the alignment is appropriate and valid, and (3) identify the content reflected in item-level specifications.)

Item and Stimulus: Item represents the question being asked, while stimulus is supporting information, graphics, animation or simulation included with some items.

Answer Key: The expected student response or example response including score point value.

Rubric and Exemplar: Rubric explains what is needed for each score point. Exemplars give a sample response from a student.

While each item is aligned to a specific PE through its dimensions, certain items, based on their contexts, incorporate aspects of environmental literacy outlined in the Environmental Principles and Concepts adopted by the State Board of Education in 2004. The items in this training test are not fully representative of the full range of ways items can incorporate environmental literacy.

The training test items will include numbered instructional text preceding the first item.

Introduction to Training Test Answer Guide

Each item that follows has metadata as shown below. Metadata contains the specific information on the alignment of the item to the NGSS standards. The item number in the table preceding each sample item corresponds to the sequence number of the item as it appears in the training test.

Example of Metadata

Item	Grade	PE	SEP	DCI	CCC	DOK
2	High School	HS-ESS2-5	3. Planning and carrying out Investigations	ESS2.C The Roles of Water in Earth's Surface Processes	6. Structure and Function	2

ILCS: Plan and carry out an investigation on the rate of water flow in a river and its impacts on the surrounding environment.

Environmental Principle III: Natural systems proceed through cycles that humans depend upon, benefit from, and can alter.

High School Braille Sample Items

Item	Grade	PE	SEP	DCI	CCC	DOK
2	High School	HS-ESS2-5	3. Planning and carrying out Investigations	ESS2.C The Roles of Water in Earth's Surface Processes	6. Structure and Function	2

ILCS: Plan and carry out an investigation on the rate of water flow in a river and its impacts on the surrounding environment.

Environmental Principle III: Natural systems proceed through cycles that humans depend upon, benefit from, and can alter.

2

Engineers were studying water flow rates and the erosion of a nearby creek. Concern was raised because the flow rate of the creek changed enough to cause an increase in erosion around the creek. This resulted in habitat loss for several endangered species. Several agencies worked together to implement a plan to protect both the infrastructure and environment within the creek area.

In order to understand the results of stream flow rates, students in an ecology class were assigned to investigate the effects of water velocity on stream shape and sediment transport.

The students created three different models of water velocity. Select a water velocity model to investigate.

(Item 2 continues on the next page.)

High School Braille Sample Items

Rivers can have different path shapes depending on water flow. The path shapes are often labeled as youthful, mature, and old age. Based on your selected water velocity, which label **best** describes the river path shape demonstrated by the stream table?

- Ⓐ youthful
- Ⓑ mature
- Ⓒ old age

Based on your selected water velocity, the stream table should show a valley and sediments transported downstream.

1 point

Exemplars:

The student selects a Water Velocity of Low, the river path shape of C, old age, and completes the sentence for Low water velocity flow by selecting broad U-shape and clay.

OR

The student selects a Water Velocity of Medium, the river path shape of B, mature, and completes the sentence for Medium water velocity flow by selecting narrow U-shape and sand and clay.

OR

The student selects a Water Velocity of High, the river path shape of A, youthful, and completes the sentence for High velocity water flow by selecting V-shape, gravel, sand and clay.

Rubric:

The student selects one of the three combinations provided in the key.

0 points

Rubric:

The student chooses any different combination than provided in the key.

Item	Grade	PE	SEP	DCI	CCC	DOK
3	High School	HS-LS4-3	4. Analyzing and interpreting data	LS4.B Natural Selection	1. Patterns	2

ILCS: Analyze and interpret heritable traits between two fruit flies and explain why certain traits are not present within the population of offspring.

In this performance task, you will answer six questions.

You will be using fruit flies, *Drosophila melanogaster*, to study genetics. Fruit flies are studied because they have a short life cycle and have only 4 pairs of chromosomes. The flies will be crossed to observe the inheritance patterns of eye color and wing shape. The fruit flies are kept in jars with pieces of banana to serve as a nutrient source. The fruit flies were ordered from a supply company, and each jar contains its own phenotype.

A long-winged fly is crossed with a short-winged fly and allowed to mate. The phenotype of the offspring is observed and recorded in the data table.

Fly Phenotype	Number Observed
Long-winged fly	146
Short-winged fly	0

3

Based on the results in the data table, explain why there are no flies with short wings. Enter your answer in the box.

☰ ☲ ☱ ☴
✂️ 📄 📄 ↶ ↷
ABC English ▼ Ω

1 point

Exemplar:

“There are no flies with short wings because the alleles for long wings are dominant.”

OR

“There are no flies with short wings because the alleles for short wings are recessive.”

Rubric:

The student demonstrates a full understanding of the Performance Expectation, including aspects of applying concepts of statistics and probability in the expression of genetic information. The differential survival and reproduction of organisms in a population that have an advantageous heritable trait leads to an increase in the proportion of individuals in future generations that have the trait and to a decrease in the proportion of individuals that do not.

0 points

Exemplar:

“There are no short-winged flies because short wings are a lethal mutation and the offspring did not survive.”

Rubric:

The student demonstrates little or no understanding of the Performance Expectation.

Item	Grade	PE	SEP	DCI	CCC	DOK
4	High School	HS-LS3-3	4. Analyzing and interpreting data	LS3.B Variation of Traits	3. Scale, proportion, and quantity	2

ILCS: Analyze the data collected and interpret the percent of offspring that have a particular trait.

To further the study, two long-winged flies from the F1 generation are crossed and produce an F2 generation. The number and phenotype of the offspring are shown.

	Long-winged fly	
	Long-winged fly 54 flies	Long-winged fly 53 flies
Long-winged fly	Long-winged fly 55 flies	Short-winged fly 52 flies

4

What percent of the F2 generation is expected to be heterozygous for long wings?

%

Key: 50 (1 point)

High School Braille Sample Items

Item	Grade	PE	SEP	DCI	CCC	DOK
5	High School	HS-LS3-3	4. Analyzing and interpreting data	LS3.B Variation of Traits	3. Scale, proportion, and quantity	2

ILCS: Interpret the results of the Punnett square in terms of recognizing the parental genotypes.

To further the study, two long-winged flies from the F1 generation are crossed and produce an F2 generation. The number and phenotype of the offspring are shown.

	Long-winged fly	
	Long-winged fly 54 flies	Long-winged fly 53 flies
Long-winged fly	Long-winged fly 55 flies	Short-winged fly 52 flies

5

Using "A" to represent the dominant trait and "a" to represent the recessive trait, what are the genotypes of the parents in the F1 generation?

Key: Aa (1 point)

Item	Grade	PE	SEP	DCI	CCC	DOK
6	High School	HS-LS3-2	7. Engaging in argument from evidence	LS3.B Variation of Traits	2. Cause and effect: mechanism and explanation	2

ILCS: Analyze the evidence provided in the Punnett square to determine the correct parental genotypes that would be expected to produce the offspring shown.

6

Use the Punnett square provided to identify the correct parents that would be expected to produce approximately 50% homozygous brown-eyed offspring and 50% heterozygous offspring.

The genotypes of the parents would be

- Ⓐ rr and RR
- Ⓑ rr and Rr
- Ⓒ Rr and RR
- Ⓓ rr and rr
- Ⓔ Rr and Rr

Key: B (1 point)

High School Braille Sample Items

Item	Grade	PE	SEP	DCI	CCC	DOK
7	High School	HS-LS4-2	6. Constructing explanations (for science) and designing solutions (for engineering)	LS4.B Natural Selection	2. Cause and effect: mechanism and explanation	3

ILCS: Understand how particular traits are maintained in a population and construct an explanation based on the results of the Punnett square.

To allow the students to observe an additional trait, the teacher gives them a fly with a darker body color than the other flies, which have a lighter body color. The students crossed the dark-body-colored fly with the light-body-colored fly. The cross is represented in the Punnett square.

7

The students then crossed two flies from the F1 generation and recorded the following results:

162 light-body-colored fruit flies

52 dark-body-colored fruit flies

Explain how the dark body color of the fruit flies remained in the gene pool.

? 🔍 **B** *I* U ~~I_x~~
☰ ☱ ☲ ☳ ✂ 📄 📁 ↶ ↷
ABC English ▼ Ω

2 points

Exemplar:

“Light-bodied flies carry a recessive allele for dark body color, and the offspring homozygous for the recessive trait appear.”

Rubric:

The student demonstrates a full understanding of the Performance Expectation, including aspects of constructing explanations based on evidence obtained from a variety of sources; AND that natural selection occurs only if there is variation in the genetic information between organisms in a population.

1 point

Exemplar:

“The alleles for dark body color are recessive.” OR “Homozygous offspring can appear later.”

Rubric:

The student demonstrates a partial understanding of the Performance Expectation.

0 points

Exemplar:

“The alleles for dark body color are dominant and will appear in the offspring.”

Rubric:

The student demonstrates little or no understanding of the Performance Expectation.

High School Braille Sample Items

Item	Grade	PE	SEP	DCI	CCC	DOK
8	High School	HS-LS4-3	4. Analyzing and interpreting data	LS4.B Natural Selection	1. Patterns	2

ILCS: Interpret the data presented in the Punnett square to determine the correct percentages of genotypes.

8

The Punnett square shows the possible results of a cross between two flies from the F1 generation.

		Light body color	
		Light body color 53	Light body color 49
Light body color		Light body color 50	Dark body color 48
		F2 generation	

Based on the Punnett square, determine what percentage of each genotype is in the F2 generation. The genotype BB represents percent of the F2 generation. The genotype Bb represents percent of the F2 generation. The genotype bb represents percent of the F2 generation.
